A very simple plantation

- Dig a trench 60 cm wide and 35 cm deep.
- Check the drainage of the soil: if the soil is too heavy, add 10 to 15 cm of lava rock or Rhine sand to the bottom of the trench.
- Loosen the soil at the bottom of the trench: feel free to add professional potting soil and mix it with the existing soil.
- Check that the soil is free of disease and has the correct acidity level (pH).
- Place the hedge plants in their biodegradable cardboard containers in the trench, ensuring that the container does not protrude above the soil surface and that the root collar is not covered.
- Fill and compact the trench with the mixture of existing soil and professional potting soil.
- Install the drip irrigation hose provided over the root ball.
- The root ball should remain slightly moist until the winter following planting.
